Experiment - 4 FAQs

Q1 Define data, data item and entity.

Ans Data are simply values or sets of values. Data Item is single unit of values. Entity is something which has certain attributes which may be assigned values.

Attribute	Name	Age	City
Value	xyz	16	Pune

Q2 Define data structure.

Ans A data structure is a way of organizing data that considers not only the items stored, but also their relationship to each other. Advance knowledge about the relationship between data items allows designing of efficient algorithms for the manipulation of data.

3 What are the types of data structure? Give examples.

Ans Primitive and Non primitive, linear and non linear data structures.

Linear data structures: Arrays, linked list.

Nonlinear data structures: trees, graphs.

4 What is nested structure?
Ans Nested structure in C is nothing but structure with a structure.

5 What are Unions?
Ans Unions are same as structures. Unions are constructed / user defined data type which can group together different data types.

6. Compare structures with unions.
Ans All members of structures can be accessed at any time. But only one member of union can be accessed at a time in case of union and other members will contain garbage values.

7. What are the operators used to access data from structures?
Ans The operators used to access the data from structures are dot (.) and arrow (->)

8 What is array of structure?
Ans To declare an array of a structures, we first define a structure and then declare an array variable of that type.

9 List out applications of structures.
Ans Used in database management and forming an array of structures etc.

10. How to access structure member through pointer ?

Ans A structure's member can be accessed through pointer in two ways

1. Referencing pointer to another address to access memory
2. Using dynamic memory location.
